1 SAFETY RULES FOR USING WELDING MACHINE

1.1 INTRODUCTION

Before using this device all people authorized to use, repair or service it should read the following use and safety instructions. Remember: YOUR SAFETY DEPENDS ON YOU!!!

1.2 GENERAL PRECAUTIONS

1.2.1 Fire

- Avoid causing fire because of sparks, slag, hot metal or pieces.
- Make sure that suitable fire-fighting equipment is available close to welding area.
- Remove all flammable and combustible material from the welding area and its surrounding (32 fr minimum).
- Do not weld containers of combustible or flammable material, even when empty. These must be carefully cleaned before being welded.
- Allow the welded material to cool down before touching it or putting it in contact with combustible or flammable material.
- Do not weld parts with hollow spaces, containing flammables.
- Do not work under conditions with high concentrations of combustible vapours, gases, or flammable dust.
- Always check the work area half an hour after welding so as to make sure that no fire has started.
- Do not keep any combustible material such as lighters or matches in your pockets.

1.2.2 Burns

- Wear fire-proof clothing all over your body in order to protect your skin against burns caused by ultra-violet radiation given off by the arc, and from weld metal sparks and slag.
- Wear protective clothing-gauntlet gloves designed for use in welding, hat and high safety-toe shoes. Button shirt collar and pocket flaps, and wear cuff-less trousers to avoid entry of sparks and slag.
- Wear helmet with safety goggles and glasses with side shields underneath, appropriate filter lenses or plates (protected by clear cover glass). This is a MUST for welding to protect the eyes from radiant energy and flying metal. Replace cover glass when broken, pitted, or spattered.
- Avoid oil or greasy clothing. A spark may ignite them.
- Hot metal such as electrode stubs and workpieces should never be handled without gloves.
- First-aid facilities and a qualified first-aid person should be available for each shift unless medical facilities are close by for immediate treatment of flash burns of the eyes and skin burns.
- Ear plugs should be worn when working on overhead or in a confined space. A hard hat should be worn when others work overhead.
- Flammable hair preparations should not be used by persons intending to weld or cut.

1.2.3 Fumes

Welding operations give off harmful fumes and metal dusts which may be hazardous to your health, therefore:
- Work in a well-ventilated area.
- Keep your head out of fumes.
- In closed areas, use suitable exhaust fans.
- If ventilation is not enough, use breathing sets approved for this procedure.
- Clean the material to be welded of any solvents or halogen degreasers giving rise to toxic gases. Some chlorine solvents may decompose with the radiation emitted by the arc, and create phosgene gas.
- Do not weld plated metals or those containing lead, graphite, cadmium, zink, chrome, mercury or beryllium, unless you have the proper breathing set.
- The electric arc creates ozone. A long exposure to high concentrations may cause headaches, nasal, throat and eye irritation as well as serious congestions and chest pains.

1.2.4 Explosions

Do not weld above or near containers under pressure.
- Do not weld in environments containing explosive dusts, gases or vapours.
This welding machine uses inert gases such as CO₂, ARGON, or a mixture of ARGON + CO₂ for the protection of the arc, thus you should take special precautions:

A) CYLINDERS
- Do not directly connect cylinder to the machine gas hose without a pressure regulator.
- Handle or use pressure cylinders in conformity with the existing rules.
- Do not use leaking or damaged cylinders.
- Do not use cylinders which are not well secured.
- Do not carry cylinders without the protection of the installed valve.
- Do not use cylinders whose content has not been clearly identified.
- Never lubricate cylinder valves with oil or grease.
- Do not put the cylinder in electrical contact with the arc.
- Do not expose cylinders to excessive heat, sparks, molten slags or flame.
- Do not tamper with the cylinder valves.
- Do not try to loosen tight valves by means of hammers, keys, or any other object.
1.2.6 Electric shock

Electric shock can kill.
- All electric shocks are potentially fatal.
- Do not touch live parts.
- Insulate yourself from the piece to be cut and from the ground by wearing insulated gloves and clothing.
- Keep garments (gloves, shoes, hats, clothing) and body dry.
- Do not work in humid or wet areas.
- Avoid touching the piece to be welded.
- Should you work close to or in a dangerous area, use all possible precautions.
- If you should even the slightest electric shock sensation, stop welding immediately. Do not use the machine until the problem is identified and solved.
- Always fit an automatic wall switch with adequate power, possibly close to the machine, allowing you to immediately switch the machine off in case of an emergency.
- Frequently inspect the power supply cable.
- Disconnect power supply cable from mains before replacing cables or before removing unit covers.
- Do not use the unit without protection covers.
- Always replace any damaged parts of the unit, with original material.
- Never disconnect unit safety devices.

1.2.7 Pace maker

- Magnetic fields from high currents can affect pacemaker operation. Persons wearing electronic life support equipment (pacemaker) should consult their doctor before going near arc welding, gouging or spot welding operations.

1.2.8 Caution!

- Welding wire can cause puncture wounds.
  - Do not press gun trigger until instructed to do so.
  - Do not point gun toward any part of the body, other people, or any metal when threading welding wire.

1.2.9 Moving parts can cause injury.

Moving parts, such as fans, can cut fingers and hands and catch loose clothing.
- Keep all doors, panels, covers, and guards closed and securely in place.
- Have only qualified people remove guards or covers for maintenance and troubleshooting as necessary.
- Keep hands, hair, loose clothing, and tools away from moving parts.
- Reinstall panels or guards and close doors when servicing is finished and before starting the machine.

2 GENERAL DESCRIPTION

2.1 SPECIFICATIONS

This welding machine is a semiautomatic, constant voltage generator. It is possible to weld mild steel, stainless steel, and aluminium.

2.2 EXPLANATION OF TECHNICAL SPECIFICATIONS

N° Serial number which must be stated when asking for information or servicing related to this machine.

1<sub>-</sub> Single-phase Transformer - Rectifier

3<sub>-</sub> Three-phase Transformer - Rectifier

U<sub>o</sub> External characteristic of the unit.

Secondary no-load voltage (peak value).

The duty-cycle expresses the percentage of 10 minutes during which the welding machine can operate at a determined current level without overheating:

E.g. X = 60% at I<sub>r</sub> = 100 A.

This means that the welding machine can weld with a current I<sub>r</sub> = 100 A for 6 minutes out of 10, i.e. 60%.

I<sub>r</sub> Welding current

I<sub>2</sub> Secondary voltage with welding current I<sub>r</sub>

U<sub>0</sub> Nominal supply voltage at the rated frequency.

I<sub>s</sub> Input current at the corresponding welding current I<sub>r</sub>

IP 21 Grade of protection of the case.

Grade 1 as a second digit means that this unit is not fit for working in the rain.

Fit for working in high-risk areas.
2.3 DESCRIPTION OF PROTECTION

This unit is protected by a normally closed thermostat placed on the power transformer. When the thermostat intervenes, the machine stops welding, while the motor-driven fan continues to work. Wait a few minutes to allow the generator to cool down.

3 INSTALLATION

3.1 PRECAUTIONS

WARNING!! ELECTRIC SHOCK CAN KILL

- This machine must be installed by skilled personnel.
- Make sure that the input power plug has been disconnected before inspecting, repairing, or servicing.

3.2 SETUP

Unpack the machine and place it in a properly ventilated area, possibly not dusty, making sure that air flow on the cooling vents is not obstructed. WARNING: RESTRICTED AIR FLOW causes overheating and possible damage to internal parts.

- Maintain at least 20 inches (500 mm) of free space on all sides of the unit.
- Do not place any filtering device over the intake air vents of this power source. The warranty is void if any type of filtering device is used.

3.3 STARTUP

This unit must be installed by skilled personnel. All fittings must be in conformity with the existing safety standards. (See CEI standards 26-10 - CENELEC HD 427).

Install the components supplied with the welding machine. Connect the welding torch (70).

Check that the wire diameter corresponds to that shown on the drive roll and mount the wire spool.

Make sure that the wire goes into the groove of the drive roll (11) and that wire and groove are perfectly aligned.

Before connecting the power supply cable (40) ensure that mains voltage corresponds to the machine voltage, then:

a) for permanent connection to the power mains without a plug, you must insert a main switch having a suitable capacity in compliance with the rated specifications.

b) for a plug-socket connection, use a plug having a suitable capacity in compliance with the rated specifications. In this case the plug must be used to completely disconnect the machine from the mains, after setting the switch 56 to “O” (off).

The yellow-green wire must be connected to the earth terminal.

The connection voltage can be changed on the three-phase machine by following the instructions in figure.

N.B. TO REACH THE VOLTAGE CHANGER REMOVE THE FIXED HOUSING (44).

IMPORTANT: BEFORE CHANGING VOLTAGE MAKE SURE THAT THE MACHINE IS NO MORE CONNECTED TO THE MAINS.

Connect the ground clamp (60) to the workpiece. The welding circuit must not be deliberately placed in direct or indirect contact with the protection wire except in the workpiece.

If the workpiece is deliberately grounded using the protection wire, the connection must be as direct as possible, using a wire at least as large as the welding current return wire, and connected to the workpiece at the same point as the return wire, using the return wire clamp or a second grounding clamp placed next to it.

All precautions must be taken to avoid stray welding currents.

Turn the machine on by means of the switch (56).

Remove the taper gas nozzle (71) by rotating it clockwise.

Unscrew the contact tip (72).

- Do not point gun toward any part of the body, other people, or any metal when threading welding wire.

Welding wire can cause puncture wounds.

Press the torch push button (70) and release it only when the wire comes out.
Tighten the contact tip (72) and make sure that the hole diameter corresponds to the wire being used. Reinstall the taper gas welding nozzle (71), rotating it clockwise.

**WARNING!!**
**ELECTRIC SHOCK CAN KILL.**
- Do not touch live electrical parts.
- Do not touch the weld output terminals when the unit is energized.
- Do not touch the torch or electrode holder and the work clamp at the same time.

ATTENTION: The green/yellow wire of the input power cable must always be connected to the protection lead (ground of the system). The yellow/green wire must NEVER be combined with another phase wire for drawing voltage.

### 3.4 CONNECTING THE GAS HOSE

**WARNING!!**
**CYLINDERS CAN EXPLODE IF DAMAGED**
- Keep the cylinders in an upright position by chaining them to their support.
- Keep the cylinders in a place where they cannot be damaged.
- Do not lift the machine with the cylinder on its support.
- Never touch the cylinder with the welding wire.
- Keep the cylinder away from the welding area and uninsulated electric circuits.
- Cylinders containing inert gas have to be equipped with a regulator and a flowmeter.
- After having positioned the cylinder, connect the gas hose that comes out from the rear of machine to the pressure regulator. The gas hose shall be chosen according to the process in use (see 3.5 E). Turn the gas cylinder on and adjust the flowmeter to approx. 8-10 litre/min.

### 3.5 UNIT DESCRIPTION

**A)** **On/Off switch.**
Switches the welder on and off. On some versions this switch is also used to select the welding voltage range.

**B)** **Wire speed adjuster knob.**
Use this knob to set the wire feed speed. This knob is only enabled when the welding torch connector (G) is selected on the mode selector switch (E).

**C)** **Spot time adjuster knob.**
Use this knob to set the spot welding duration time. When the button on the welding gun is pressed, the machine will start spot welding and continue for the time set on this knob. To start the next welding cycle, release and press the welding torch button.

**D)** **Welding voltage selector switch.**
Use this selector switch to set the welding voltage.

**E)** **Mode selector switch.**
This switch is used to select one of the following operating modes:

1) Selector switch (E) in position . This enables the welding torch connector (G); the MIG torch (supplied) must be connected to the connector. Use the knob (B) on the front control panel to set the wire feed speed. When selecting this process, you have to connect the bottle to its corresponding gas hose. See back panel.

2) Selector switch (E) in position . This enables the extension cable connector (H); the extension cable (art. 1324 supplied as an optional) must be connected to the connector. The extension cable also has a plug which must be connected to the remote connector (F) on the front control panel.

The extension cable (art. 1324) can either be plugged into the spool gun (art. 1562) or into the separate wire feeder (art. 1424) fitted with optional accessories.

For instructions on the fitting and use of these accessories, see the manuals supplied with these units. When selecting this process, you have to connect the bottle to its corresponding gas hose. See back panel.

**F)** **Remote connector.**
Connector for the extension cable (art. 1324).

**G)** **Welding torch connector.**
Connector for the welding torch (supplied).

**H)** **Extension cable connector.**
Connector for the extension cable (art. 1324).

**I)** **Fe and Al earth socket.**
Connect the earth cable clamp to these sockets. The socket shall be chosen according to the used material. (see paragraph 4).

**J)** **Ammeter.**
The ammeter displays the welding current.

**M)** **Green led.**
This lights up when the mode selector switch (E) is in the position.

**N)** **Green led.**
This lights up when the mode selector switch (E) is in the position.
O) **Green led.**
   This lights up when the torch button is pressed and indicates that the two solenoid valves are operating correctly.

P) **Yellow led.**
   This lights up when the thermostat interrupts welder operation.

Q) **Green led.**
   This lights up when the selector switch (C) is on.

R) **Warning light.**
   This lights up to indicate that the machine is switched on.

### 3.6 GENERAL NOTES

Before using this welding machine, carefully read the CEI Standards 26/9 or CENELEC HD 407 and CEI 26/11 or CENELEC HD 433, also check for insulation of cables, torch and earth cable.

When you have finished welding, switch off the welder and shut off the gas cylinder.

### 4 WELDING GUIDELINES

#### 4.1 SPOT WELDING

For spot welding, replace the gas-weld nozzle with the special spot-weld nozzle. Exert enough pressure with the torch to achieve a good junction of metal sheets. This can be obtained by positioning the knob (C) on "spot-time" and adjusting the spot-welding time through the knob.

**ATTENTION:** Metal sheets will have to be perfectly clean.

#### 4.2 MILD-STEEL WELDING

75% ARGON + 25% CO2 or 100% CO2 can be used for mild steel welding. Adjust the welding voltage with switch (55) (56), the gas hose corresponding to the process in use and connect the earth cable to the socket (I) marked with the symbol Fe.

- Approach the point to be welded and press the torch push button (70).
- Adjust the potentiometer until the welding noise is constant and continuous.

If the speed is too high, the wire tends to get stuck on the workpiece which makes the torch bounce back. If speed is too low, the wire melts irregularly or else the arc switches off. When you have finished welding, switch off the welder and shut off the gas cylinder.

See the figure for correct torch inclination.

#### 4.3 ALUMINIUM WELDING

The machine will be set up as for mild-steel welding except for the following changes:
- 100% ARGON as welding protection gas.
- Connect the earth cable to the socket (I) marked Al.
- Wire of composition suitable for the material to be welded.
   — For ALUMAN welding wire 3þ5% silicon.
   — For ANTICORODAL welding wire 3þ5% silicon.
   — For PERALUMAN welding wire 5% magnesium.
   — For ERGAL welding wire 5% magnesium.

If you only have a torch for steel wires, the same shall be modified in the following way:
- Make sure that length of torch cable does not exceed 118 inches (it is advisable not to use longer torches).
- Remove the brass sheath-holding nut, the gas and the current nozzles, then slip the sheath off.
- Insert the teflon sheath for aluminium and ensure it protrudes from both ends.
- Screw the current nozzle so that the sheath adheres to it.
- Insert the sheath holding nipple and the O-Ring in the free end of the sheath and secure with the nut without tightening too much.
- Slip the brass tube on the sheath and insert both into the adapter (after removing the iron tube which was fitted inside the adaptor).
- Cut the sheath diagonally so that it stays as close as possible to the wire drive roller.

Use drive rolls that are suitable for aluminium wire. The wire pressing roll must be properly tightened.

Make sure that the diameter of the contact tip hole corresponds to the wire diameter that is going to be used. Use abrasive grinders and tool brushes specifically designed for aluminium. Never use these tools on other materials.

**REMEMBER** that cleanliness equals quality. The wire spools must be stored in plastic bags with a dehumidifier.

See the figure for correct torch inclination.

#### 4.4 STAINLESS STEEL WELDING

The machine will be set-up as for mild-steel welding except for following changes:
- Stainless steel wire compatible with the composition of steel to be welded.
- Cylinder containing a mixture of 98% ARGON + 2% O2 (recommended mixture).

**NOTE:** Recommended torch inclination and welding direction are shown in the figure.

#### 5 MAINTENANCE AND CHECK UP

Maintenance must only be carried out by suitably qualified personnel.

##### 5.1 GENERAL NOTES

**WARNING:** ELECTRIC SHOCK CAN KILL
- Do not touch live electrical parts.
- Turn off the power source, and remove input power plug from receptacle before inspection, maintenance, or servicing.
- MOVING PARTS can cause serious injury.
- Keep away from moving parts.
- HOT SURFACES can cause severe burns.
- Allow cooling period before servicing.

Periodically clean the transformer or diodes from any dust or foreign bodies; for this purpose, use a dry and clean air jet.
When reinstalling the drive roll, ensure that the groove is aligned with the wire and that it corresponds to the diameter of the wire used. Keep the inside of the gas nozzle constantly clean so as to avoid metal bridges formed by welding spatter between the gas nozzle and the contact tip. Make sure that the contact tip outlet has not widened, if so, replace it. The torch must not be banged or violently knocked.

### 5.2 WELDING MACHINE SERVICING

Experience has shown that many fatal accidents originated from servicing improperly executed. For this reason, a careful and thorough inspection on a serviced welding machine is just as important as one carried out on a new welding machine. Furthermore, in this way producers can be protected from being held responsible for defects stemming from repairs not carried out by the manufacturer.

#### 5.2.1 Prescriptions to follow for servicing

- After rewinding the transformer or the inductance, the welding machine must pass the applied-voltage test in accordance with indications in table 2 of 6.1.3 of the EN 60974.1 (standard CEI 26.13). Conformity must be checked as specified in 6.1.3.

- If no rewinding is done, a welding machine which has been cleaned and/or reconditioned must pass an applied-voltage test with voltage values equal to 50% of the values given in table 2 of 6.1.3. Conformity must be checked as specified in 6.1.3.

- After rewinding and/or the replacement the no-load voltage shall not exceed the values given in 10.1 of EN 60974.1.

- If the servicing is not done by the manufacturers, the repaired welding machines which underwent replacements or modifications of any component, shall be marked in a way such that the identity of the person having serviced it is clear.

#### 5.2.2 Instructions to be followed after all repair work.

Following any repair work, great care must be taken when refitting cables and wires to ensure safe and proper insulation between the primary and secondary sides of the machine. When refitting wires and cables, ensure that wires cannot come into contact with moving parts or those parts which heat up during operation. Refit clips and straps in their original position and in such a way that any accidental cable breakage or disconnection will not lead to a dangerous contact between the primary and secondary circuits.

---
